

VCFcache remains useful with fastVEP

52 real-world WGS evaluation genomes · one run per genome and condition

fastVEP 0.3.0 · VCFcache --statistics light · KPGP, SGDP and PGP.
All 156 cached outputs passed strict complete-record and relevant-header comparison against direct fastVEP.
Bundled-cache rows use locally built fastVEP caches derived from the corresponding VCFcache Zenodo blueprints; cohort caches use three separate build genomes.
