

VCFcache remains useful with fastVEP

52 real-world WGS evaluation genomes · one run per genome and condition

A

VCFcache accelerates fastVEP across all cache strategies

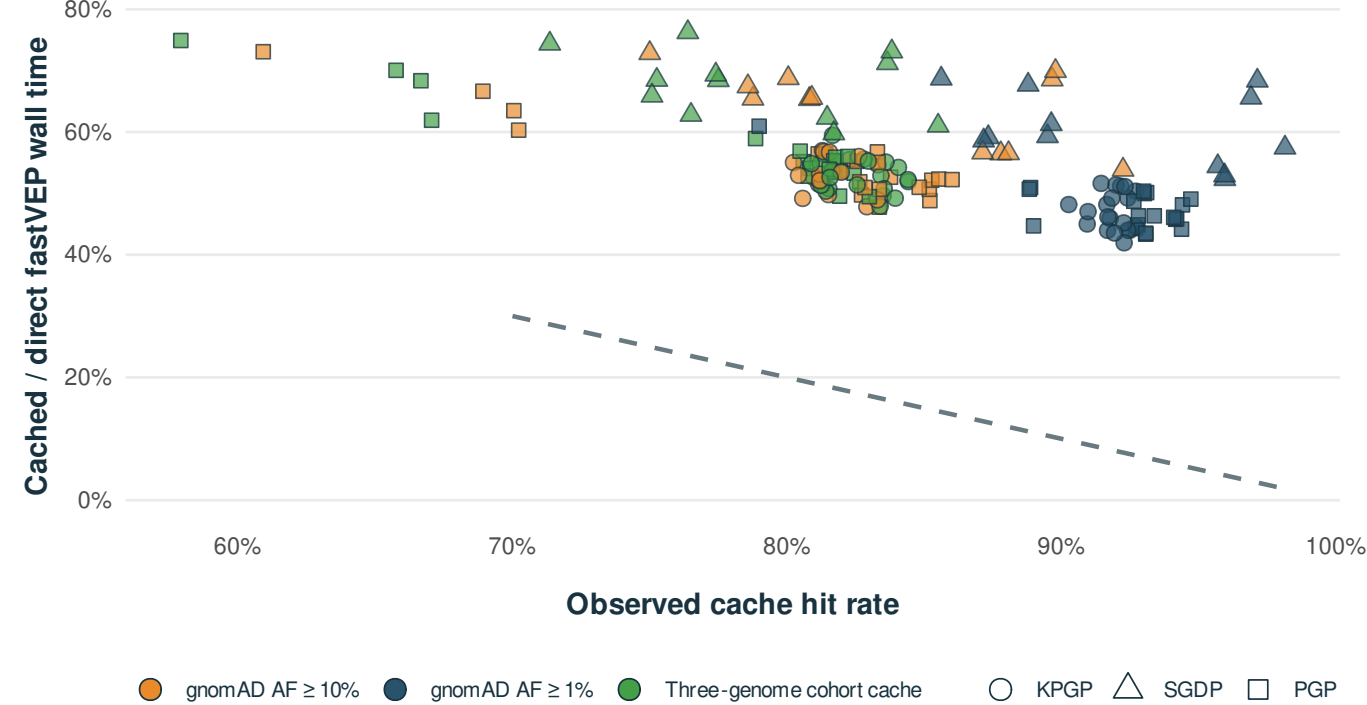

Each point is one independent evaluation genome; box lines show medians

B

Fixed cache-processing cost limits the theoretical maximum

Dashed line is the zero-overhead miss-fraction rule

C

Minutes per whole genome fall even for a fast annotator

Identical input genomes and fastVEP configuration
