

Alternative view: real-world WGS benefit at a glance

One run per sample and condition · bundled Zenodo caches versus cohort-derived reuse

A

A workday becomes a much shorter wait

Median wall time per real-world genome · white = direct VEP · colored = VCFcache

B

Cache reuse across external genomes

Held out from cohort-cache construction; no documented gnomAD project overlap

C

Hours returned for every genome

Positive values are measured wall time saved
