

Independent real-world WGS: bundled versus cohort-derived caches

KPGP, SGDP and PGP held-out genomes · one technical execution per sample

A

Runtime remaining by cache strategy

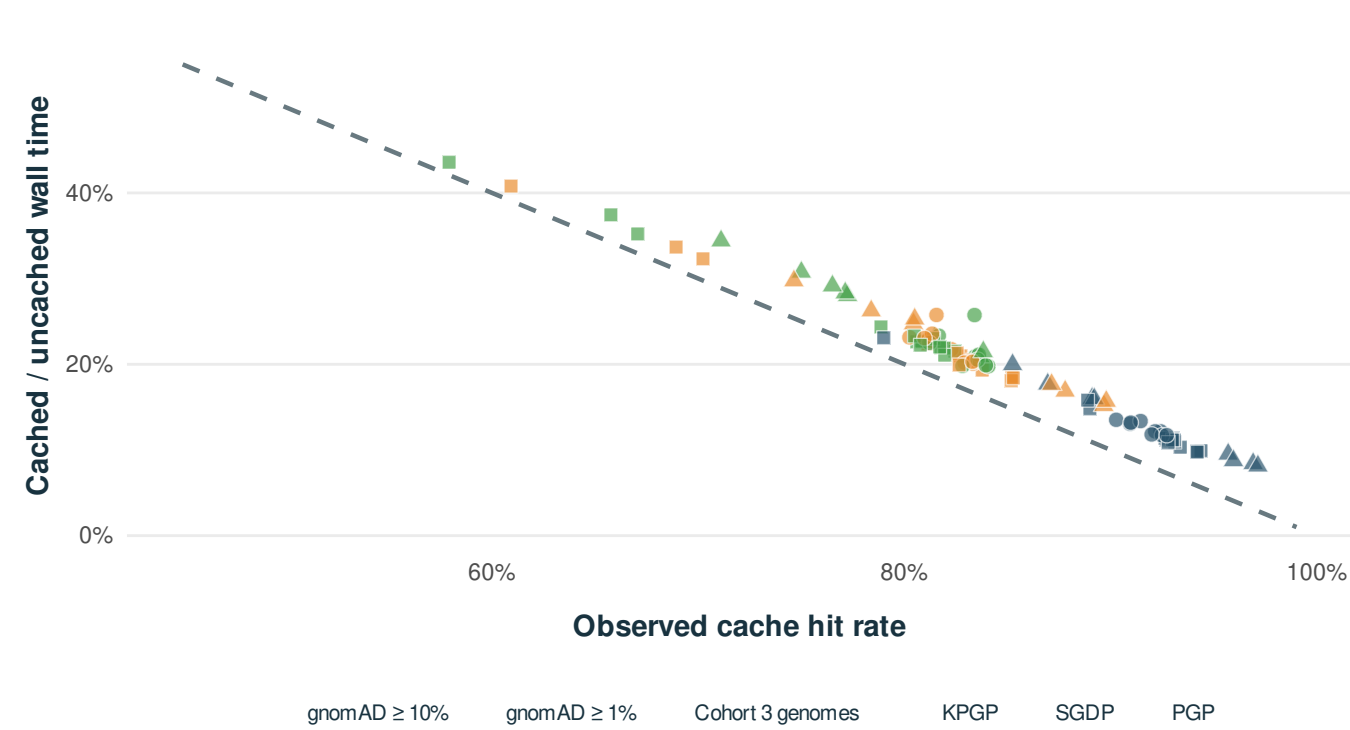

Points are held-out genomes; boxes summarize only the completed snapshot

B

Observed behavior follows the miss fraction

Dashed line: zero-overhead rule; vertical excess is lookup and preprocessing

C

A custom cache repays its one-time build cost

Effective speedup includes measured three-genome cache construction
